PV Axial piston pump

PV Series axial piston pump

nominal pressure: 350 bar

max. pressure: 420 bar

1. New type of swash plate and large servo piston with strong bias spring achieves fast response, reduce the noise due to active decompression of system at down stroke.

2. Nine pistons and new precompression technology (precompression filter volume) result in unbeaten low outlet flow pulsation.

3. Complete compensator program offers multiple controls.

4. Rigid and FEM-optimized body design for lowest noise level.

5. Thru drive for 100% nominal torque.

6. Pump combinations (multiple pumps) of same size and model and mounting interface for basically all metric or SAE mounting interfaces.

7. Wide application in automobile industrial, ships, forging machines, tire machines, injection molding machines, machine tools, special-purpose machine.

1. Outlet port is on the top, the pipe pressure should be less than 2 bar.

2. The usage of max. Pressure for each circle never exceed 6 seconds. Please see the General Installation Information for hydraulic oil cleanliness manual.

3. YEOSHE offers tandem pump or other types of pump connection. The mounting has Metric and SAE dimensions.

Pressure & Flow Adjustment

A

8

PV Axial piston pump

A0 Standard pressure compensator

A0 Standard pressure compensator

The standard pressure compensator adjusts the pump displacement according to the actual need of the system in order to keep the pressure constant.

As long as the system pressure at outlet port P is lower than the set pressure (set as spring preload of the compensator spring) the working port A of the compensator valve is connected to the case drain and the piston area is unloaded. Bias spring and system pressure on the annulus area keep the pump at full displacement.

When the system pressure reaches the set pressure the compensator valve spool connects port P1 to A and builds up a pressure at the servo piston resulting in a downstroking of the pump.

The displacement of the pump is controlled in order to match the flow requirement of the system.

LN None pressure compensator (fixed displacement) (pressure protection required)

(Diagrammatic sketch)

LN None pressure compensator
(fixed displacement) (pressure protection required)

By using the system under stable displacement and pressure situation, standard pressure compensator can be omitted which helps cost down.

Notice:

External pressure protection is necessarily added at port PM to limit the pressure; otherwise the system pressure will be over high .

LS Electrical 2-stage flow compensator (pressure protection required)

A

11

PV Axial piston pump

LS Electrical 2-stage flow compensator (pressure protection required)

Control the hydraulic circuit change by using directional control valve.

LS control is applied to two-stage stroke and different speed system.

Notice:

External pressure protection is necessarily added at port PM to limit the pressure; otherwise the system pressure will be over high.

LC Fixed displacement 2-stage flow compensator (pressure protection required)

A

12

PV Axial piston pump

LC Fixed displacement 2-stage flow compensator (pressure protection required)

Control the hydraulic circuit change by using the system pressure setting to achieve the switch of big and small flow.

LS control is applied to two-stage stroke and different speed system.

Notice:

External pressure protection is necessarily added at port PM to limit the pressure; otherwise the system pressure will be over high.

GM Remote pressure compensator with NG6 interface

Version GM of the remote pressure compensator provides on its top side an interface NG6, DIN24340 (CETOP 03 at RP35H, NFPA D03).

This interface allows a direct mounting of a pilot valve. Beside manual or electrohydraulic operated valves, it is also possible to mount complete multiple pressure circuits directly on the compensator body.

YEOSHE offers a variety of these compensator accessories ready to install.

All remote pressure compensator have a factory setting of 15 bar differential pressure.

With this setting, the controlled pressure at the pump outlet is higher than the pressure controlled by the pilot valve.

GA Remote pressure compensator + Relief valve

A

14

PV Axial piston pump

GA Remote pressure compensator + Relief valve

The pressure is set directly at the compensator spring, and the setting of remote pressure compensator can be achieved by any suitable pilot pressure valve connected to pilot port PP.

The pilot valve can be installed remote from the pump in some distance.

That allows pressure setting, e.g. from the control panel of the machine. The pilot flow supply is internal through the valve spool, and the pilot flow is 1~1.5 L/min.

GJ Remote pressure compensator + Proportional pressure valve

A

15

PV Axial piston pump

GJ Remote pressure compensator + Proportional pressure valve

Fulfill the actual displacement and maintain the preset system pressure.

By adding YEOSHE proportional pressure valve, electrical proportional pressure control is available.

- ※ Proportional pressure max.250 bar.
If needing any other pressure range,
please contact YEOSHE.

GR Remote pressure compensator + Electrical unloading

GR Remote pressure compensator + Electrical unloading

By adding a relief valve and a directional control valve on the compensator makes the pump have both function.

GR control is for long unloading situation.

When the system stops, oil temperature and noise maintain low level while being through the unloading.

GB Remote pressure compensator + 2-stage pressure control

A

17

PV Axial piston pump

GB Remote pressure compensator + 2-stage pressure control

By adding a relief valve and directional control valve on the compensator makes it adjust two different stage limited pressure.

GB control is for two-stage working pressure under the constant cylinder speed.

Either PL or PH valve can be high pressure side.

GC Remote pressure compensator + Electrical unloading + 2-stage pressure control

A

18

PV Axial piston pump

GC Remote pressure compensator + Electrical unloading + 2-stage pressure control

Control two different-stage limited pressure by adding directional control valve, and unloading function.

When the system stops, oil temperature and noise maintain low level by unloading function.

Usable for stable cylinder speed, two-stage pressure, and long unloading situation.

Either PL or PH valve can be high pressure side.

Load-sensing compensator with NG6 interface

HM Load-sensing compensator with NG6 interface

Version HM of remote pressure compensator provides an interface NG6 on its top side.

The load-sensing compensator has an external pilot pressure supply.

Factory setting for the differential pressure is 10 bar.

The input signal to the compensator is the differential pressure at the main stream resistor.

A load-sensing compensator represents mainly a flow control for the pump output flow, because the compensator keeps the pressure drop at the main stream resistor constant.

A variable input speed or a varying load (-pressure) has consequently no influence on the output flow of the pump and the speed of the actuator.

By adding YEOSHE proportional pressure valve, electrical proportional pressure control is available.

HA Load-sensing compensator + Relief valve

HA Load-sensing compensator + Relief valve

The load-sensing compensator has an external pilot pressure supply.

Factory setting for the differential pressure is 10bar.

The input signal to the compensator is the differential pressure at the main stream resistor.

A load-sensing compensator represents mainly a flow control for the pump output flow, because the compensator keeps the pressure drop at the main stream resistor constant.

A variable input speed or a varying load(-pressure) has consequent no influence on the output flow of the pump and the speed of the actuator.

Relief valve has adjustment function.

The pilot valve can be installed remote from the pump in some distance.

That allows pressure setting, e.g. from the control panel of the machine.

The pilot flow supply is internal through the valve spool, and the pilot flow is 1-1.5 L/min.

HJ Load-sensing compensator + Proportional pressure valve

A

21

PV Axial piston pump

The load-sensing compensator has an external pilot pressure supply.

Factory setting for the differential pressure is 10bar.

The input signal to the compensator is the differential pressure at the main stream resistor.

A load-sensing compensator represents mainly a flow control for the pump output flow and the speed of the actuator.

Proportional pressure valve is for electrical proportional pressure control.

- ※ Proportional pressure max.250 bar.
If needing any other pressure range,
please contact YEOSHE.

HR Load-sensing compensator + Electrical unloading

HR Load-sensing compensator + Electrical unloading

The load-sensing compensator has all external pilot pressure supply.

Factory setting for the differential pressure is 10bar.

The input signal to the compensator is the differential pressure at the main stream resistor.

A load-sensing compensator represents mainly a flow control for the pump output flow, because the compensator keeps the pressure drop at the main stream resistor constant.

A variable input speed or a varying (load -pressure) has consequently on the output flow of the pump and speed of the actuator.

By adding a pilot orifice ($\Phi 0.8\text{mm}$) and a pressure pilot valve pressure compensation can be added to the flow control function. See the circuit diagram left.

By adding a relief valve and a directional control valve on the compensator makes the pump have both function.

HR control is for long unloading situation.

When the system stops, oil temperature and noise maintain low level while being through the unloading.

HB Load-sensing compensator + 2-stage pressure control

A

23

PV Axial piston pump

HB Load-sensing compensator + 2-stage pressure control

The load-sensing compensator has an external pilot pressure supply.

Factory setting for the differential pressure is 10bar.

The input signal to the compensator is the differential pressure at the main stream resistor.

A load-sensing compensator represents mainly a flow control for the pump output flow, because the compensator keeps the pressure drop at the main stream resistor constant.

A variable input speed or a varying (load -pressure) has consequently on the output flow of the pump and speed of the actuator.

By adding a pilot orifice ($\Phi 0.8\text{mm}$) and a pressure pilot valve pressure compensation can be added to the flow control function.

See the circuit diagram left.

By adding a relief valve and directional control valve on the compensator makes it adjust two different stage limited pressure.

HB control is for two-stage working pressure under the constant cylinder.

HC Load-sensing compensator + Electrical unloading + 2-stage pressure control

HC Load-sensing compensator + Electrical unloading + 2-stage pressure control

The load-sensing compensator has an external pilot pressure supply. Factory setting for the differential pressure is 10bar.

The input signal to the compensator is the differential pressure at the main stream resistor.

A load-sensing compensator represents mainly a flow control for the pump output flow, because the compensator keeps the pressure drop at the main stream resistor constant.

A variable input speed or a varying (load -pressure) has consequently on the output flow of the pump and speed of the actuator.

By adding a pilot orifice ($\Phi 0.8\text{mm}$) and a pressure pilot valve pressure compensation can be added to the flow control function.

See the circuit diagram left.

By adding a relief valve and a directional control valve on the compensator makes the pump have both function.

HC control is for long unloading situation.

When the system stops, oil temperature and noise maintain low level while being through the unloading.

HQ Load-sensing compensator + Proportional flow valve + Relief valve

HQ Load-sensing compensator + Proportional flow valve + Relief valve

The load-sensing compensator has an external pilot pressure supply.

Factory setting for the differential pressure is 10bar.

The input signal to the compensator is the differential pressure at the main stream resistor.

A load-sensing compensator represents mainly a flow control for the pump output flow, because the compensator keeps the pressure drop at the main stream resistor constant.

By adding YEOSHE proportional flow valve, electrical proportional flow control is available.

26

PV Axial piston pump

(Diagrammatic sketch)

HK Load-sensing compensator + Proportional pressure valve + Proportional flow valve

HK is for saving energy.

It offers the smallest pressure and flow according to the different requirement.

The displacement is nearly zero when the system stands by, and the motor output is also nearly zero.

When the system reaches setting pressure, the pump displacement will reduce by itself.

It only needs to add the system required flow, and the pressure remains the same which control the oil temperature.

Compared with vane pump, gear pump + PQ valve can save 30%-50% energy.

The load-sensing compensator + proportional flow valve has all external pilot pressure supply.

Factory setting for the differential pressure is 10 bar.

The input signal to the compensator is the differential pressure at the main stream resistor.

A load-sensing compensator represents mainly a flow control for the pump output flow of the pump and the speed of the actuator.

Proportional pressure valve is for electrical proportional pressure control.

※ Proportional pressure max.250 bar.

If needing any other pressure range, please contact YEOSHE.

BQ None-stage flow compensator (Cylinder)

None-stage flow compensator (Cylinder)

Using added cylinder, external pilot pressure controls the forward and backward, and push the swash plate to change directions and make the single-stage pressure control.

Displacement can be zero to Max, and pressure remains on setting pressure. Automatus flow control is much easier to repair, and cheaper than electrical proportional flow control.

External control is more automated by using solenoid valve or hydraulic directional valve.

VM 2-valve load-sensing compensator with NG6 interface

2-valve Load-sensing compensator with NG6 interface

Load-sensing port
G 1/4 BSPP (threads code: 1)
M12xP1.5 ISO 6149-1 (threads code: 7)
7/16-20 UNF (threads code: 3)

(Diagrammatic sketch)

VM 2-valve load-sensing compensator with NG6 interface

VM 2-valve load-sensing compensator with NG6 interface is an option for limiting pressure precisely.

By eliminating the impact between pressure and flow, the pump should add two different valves to control flow and pressure.

Version VM provides on its top side an interface NG6 which has pressure-adjusted function.

If adding a YEOSHE proportional pressure control valve, electrical proportional pressure control is available.

VJ 2-valve load-sensing compensator + Proportional pressure valve

VJ 2-valve load-sensing compensator + Proportional pressure valve

VJ 2-valve load-sensing compensator with NG6 interface is an option for limiting pressure precisely.

By eliminating the impact between pressure and flow, the pump should add two different valves to control flow and pressure.

Electrical proportional and pressure control is available by adding a YEOSHE proportional pressure valve on the Load-sensing compensator.

- ※ Proportional pressure max.250 bar.
If needing any other pressure range, please contact YEOSHE.

VQ 2-valve load-sensing compensator + Proportional flow valve + Relief valve

A

31

PV Axial piston pump

VQ 2-valve load-sensing compensator + Proportional flow valve + Relief valve

Type VQ is an option for limiting pressure precisely.

The load-sensing compensator has an external pilot pressure supply.

Factory setting for the differential pressure is 10bar.

The input signal to the compensator is the differential pressure at the main stream resistor.

A load-sensing compensator represents mainly a flow control for the pump output flow, because the compensator keeps the pressure drop at the main stream resistor constant. A variable input speed or a varying load (-pressure) consequently has no influence on the output flow of the pump and the speed of the actuator.

Electrical proportional flow control is available by adding a YEOSHE proportional flow control valve.

VK 2-valve load-sensing compensator + Proportional pressure valve + Proportional flow valve

VK 2-Valve load-sensing compensator + Proportional pressure valve + Proportional flow valve

VK control has the same characters as HK control for saving energy. It offers the smallest pressure and flow according to the different request. The displacement is nearly zero when the system stands by, and the motor output is also nearly zero.

When the system reaches setting pressure, the pump displacement will reduce by itself. It only needs to add the system required flow, and the pressure remains the same which control the oil temperature.

Compared with vane pump, gear pump + PQ valve can save 30%-50% energy.

The load-sensing compensator+ Proportional flow valve has external pilot pressure supply.

Factory setting for the differential pressure is 10 bar.

The input signal to the compensator is the differential pressure at the main stream resistor.

A load-sensing compensator represents mainly a flow control for the pump output flow of the pump and the speed of the actuator.

Proportional pressure valve is for electrical proportional pressure control.

- ※ Proportional pressure max.250 bar.
- If needing any other pressure range, please contact YEOSHE.

FV 2-valve load-sensing compensator + High reacted **YEOSHE** proportional flow valve + Flow feed back + Relief valve

A

33

PV Axial piston pump

FV 2-valve load-sensing compensator + High reacted proportional flow valve
+ Flow feed back + Relief valve

FV control is an option for limiting pressure precisely.

By eliminating the impact between pressure and flow, the pump should add two different valves to control flow and pressure.

The electrical contro permanently compares input command and actual displacement and powers the proportional flow solenoid of the control valve. A deviation from the commanded displacement leads to a modulation of the input current to the solenoid.

The control valve changes the control pressure until the correct displacement is adjusted.

FG 2-valve load-sensing compensator + High reacted proportional flow valve + Proportional pressure + Flow & Pressure feed back

(Diagrammatic sketch)

(This diagram is for PV body 1 and 2)

FG 2-valve load-sensing compensator + High reacted proportional flow valve + Proportional pressure + Flow& Pressure feed back

FG control is an option for limiting pressure precisely.

By eliminating the impact between pressure and flow, the pump should add two different valves to control flow and pressure.

By adding a YEOSHE proportional pressure valve, it would be electrical proportional pressure control.

The electrical control permanently compares input command and actual displacement and powers the proportional flow solenoid of the control valve.

A deviation from the commanded displacement leads to a modulation of the input current to the solenoid.

The control valve changes the control pressure until the correct displacement is adjusted.

Adding a pressure sensor achieves pressure feedback control.

PM Horse power compensator with NG6 interface

The hydraulic-mechanical horse power compensator consists of a modified remote pressure compensator or of a modified load-sensing compensator and a pilot valve.

This pilot valve is integrated into the pump and is adjusted by a cam sleeve.

The cam sleeve has a contour that is designed and machined for the individual displacement and the nominal horse power setting.

At a large displacement the opening pressure (given by the cam sleeve diameter) is lower than at small displacements.

This makes the pump compensate along a constant horse power (torque) curve.

Horse power is optional when order.

Working pressure can be adjusted by adding YEOSHE pressure leading valve.

Adding the proportional pressure valve achieves the electrical proportional pressure control.

※ Horse power setting, please following type code.

PA Horse power compensator + Relief valve

A

36

PV Axial piston pump

PA Horse power compensator + Relief valve

The hydraulic-mechanical horse power compensator consists of a modified remote pressure compensator or of a modified load-sensing compensator and a pilot valve.

This pilot valve is integrated into the pump and is adjusted by a cam sleeve.

The cam sleeve has a contour that is designed and machined for the individual displacement and the nominal horse power setting.

At a large displacement the opening pressure (given by the cam sleeve diameter) is lower than at small displacements.

This makes the pump compensate along a constant horse power (torque) curve.

Horse power is optional when order.

Working pressure can be adjusted by adding YEOSHE pressure leading valve.

Adding the proportional pressure valve achieves the electrical proportional pressure control.

The pilot valve can be installed remote from the pump in some distance.

That allows pressure setting e.g. from the control panel of the machine.

The pilot flow supply is internal through the valve spool and the pilot flow is 1-1.5 L/min.

※ Horse power setting, please following type code.

PJ Horse power compensator + Proportional pressure valve

A

37

PV Axial piston pump

PJ Horse power compensator + Proportional pressure valve

The hydraulic- mechanical horse power compensator consists of a modified remote pressure compensator or of a modified load-sensing compensator and a pilot valve.

This pilot valve is integrated into the pump and is adjusted by a cam sleeve.

The cam sleeve has a contour that is designed and machined for the individual displacement and the nominal horse power setting.

At a large displacement the opening pressure (given by the cam sleeve diameter) is lower than at small displacements.

This makes the pump compensate along a constant horse power (torque) curve.

Pressure-adjusted function is optional by adding a leading proportional pressure valve.

※ Horse power setting, please following type code.

※ Proportional pressure max.250 bar.

If needing any other pressure range, please contact YEOSHE.

□ = Included

(Diagrammatic sketch)

PR Horse power compensator + Electrical unloading

The hydraulic-mechanical horse power compensator consists of a modified remote pressure compensator or of a modified load-sensing compensator and a pilot valve.

This pilot valve is integrated into the pump and is adjusted by a cam sleeve.

The cam sleeve has a contour that is designed and machined for the individual displacement and the nominal horse power setting.

At a large displacement the opening pressure (given by the cam sleeve diameter) is lower than at small displacements.

This makes the pump compensate along a constant horse power (torque) curve.

Electrical unloading function is optional by adding an electric directional control valve.

This control is suitable for long period of unloading.

Oil temperature and noise remain low level through out the electrical unloading function when the system stops working.

※ Horse power setting, please following type code.

PH Horse power load-sensing compensator + Relief valve

A

39

PV Axial piston pump

PH Horse power load-sensing compensator + Relief valve

The hydraulic-mechanical horse power compensator consists of a modified remote pressure compensator or of a modified load-sensing compensator and a pilot valve.

This pilot valve is integrated into the pump and is adjusted by a cam sleeve.

The cam sleeve has a contour that is designed and machined for the individual displacement and the nominal horse power setting.

At a large displacement the opening pressure (given by the cam sleeve diameter) is lower than at small displacements.

This makes the pump compensate along a constant horse power (torque) curve.

Horse power is optional when order.

Working pressure can be adjusted by adding a leading valve on the compensator, and pump flow can also be adjusted on the first pipe by adding an external feedback on the PF port as a control signal on the main stream.

The pilot valve can be installed remote from the pump in some distance.

That allows pressure setting, e.g. from the control panel of the machine.

The pilot flow supply is internal through the valve spool, and the pilot flow is 1~1.5 L/min.

※ Horse power setting, please following type code.

PQ Horse power load-sensing compensator + Proportional flow valve + Relief valve

PQ Horse power load-sensing compensator + Proportional flow valve + Relief valve

The hydraulic-mechanical horse power compensator consists of a modified remote pressure compensator or of a modified load-sensing compensator and a pilot valve.

This pilot valve is integrated into the pump and is adjusted by a cam sleeve.

The cam sleeve has a contour that is designed and machined for the individual displacement and the nominal horse power setting.

At a large displacement the opening pressure (given by the cam sleeve diameter) is lower than at small displacements.

This makes the pump compensate along a constant horse power (torque) curve.

Pressure can be adjusted by adding a leading valve in the compensator, and pump flow can also be adjusted on the first pipe by adding an external feedback on the PF port as a control signal on the main stream.

Adding a proportional flow control valve on the P port achieves electrical proportional flow control.

※ Horse power setting, please following type code.

PS Horse power load-sensing compensator + Proportional pressure valve

A

41

PV Axial piston pump

PS Horse power load-sensing compensator + Proportional pressure valve

The hydraulic-mechanical horse power compensator consists of a modified remote pressure compensator or of a modified load-sensing compensator and a pilot valve.

This pilot valve is integrated into the pump and is adjusted by a cam sleeve.

The cam sleeve has a contour that is designed and machined for the individual displacement and the nominal horse power setting.

At a large displacement the opening pressure (given by the cam sleeve diameter) is lower than at small displacements.

This makes the pump compensate along a constant horse power (torque) curve.

Electrical pressure-adjusted function is optional by adding a leading proportional pressure valve, and pump flow can also be adjusted on the first pipe by adding an external feedback on the PF port as a control signal on the main stream.

Instructions for setting

Supply: green LED

RAMP: ramping up/down time adjustment.
For long ramping times, turn potentiometers clockwise,
for short ramping times, turn potentiometers counter-clockwise.

MAX/MIN:

I max / I min

There are multi-course potentiometers for adjustment of min-max and also ramp time.

Frequency ADJ.:

The dither frequency can be set with a jumper to 85, 140, or 300 Hz.

Technical data

Supply voltage: 10-35 VDC

Max. current: 0-2600 mA adjustable
for 12 and 24 VDC
(Output is a PWM-DC)

Min. current: 0-600 mA adjustable**Ramp adjustment:** 0~5 Sec.

Dither frequency: 85, 140, 300 Hz to
be set by jumper(Standard 140 Hz)

Ambient operating temperature: -15~140°F
-10~60°C

Weight: 0.05kg

NOTICE

Do not remove the amplifier from the coil while the power is on.

This will cause a failure in the internal circuits of the amplifier, resulting in loss of output to the coil.

Efficiency and case drain flows

PV016 , PV020
PV023 , PV028 (Body1)

The efficiency and power graphs are measured at an input speed of $n = 1500$ RPM, a temperature of 40°C and a fluid viscosity of $46 \text{ mm}^2/\text{s}$.

Case drain flow and compensator control flow leave via the drain port of the pump.

To the values shown are to be added 1 to 1.2 l/min, if at pilot operated compensators (codes G*, H*, P*, horse power compensator and p/Q-control) the control flow of the pressure pilot valve also goes through the pump.

Please note: The values shown below are only valid for static operation.

Under dynamic conditions and at rapid compensation of the pump the volume displaced by the servo piston also leaves the case drain port.

This dynamic control flow can reach up to 40 l/min! Therefore the case drain line is to lead to the reservoir at full size and without restrictions as short and direct as possible.

Efficiency and case drain flows

PV140 ~ PV180
PV210
(Body 4)

The efficiency and power graphs are measured at an input speed of $n = 1500$ RPM, a temperature of 40°C and a fluid viscosity of $46 \text{ mm}^2/\text{s}$.

Case drain flow and compensator control flow leave via the drain port of the pump.

To the values shown are to be added 1 to 1.2 l/min, if at pilot operated compensators (codes G*, H*, P*, horse power compensator and p/Q*control) the control flow of the pressure pilot valve also goes through the pump.

Please note: The values shown below are only valid for static operation.

Under dynamic conditions and at rapid compensation of the pump the volume displaced by the servo piston also leaves the case drain port.

This dynamic control flow can reach up to 40 l/min! Therefore the case drain line is to lead to the reservoir at full size and without restrictions as short and direct as possible.

Thru drive, shaft load limitations

The max. Transferable torque in Nm for the different shafts options are:

Shaft code	PV016-023 PV028	PV032-046 PV056&065	PV063-125	PV032-046 PV210	PV270
N	300	550	1320	2000	2000
D	300	610	1218	2680	2680
F	-	-	-	1320	-
G	-	-	-	1640	-
M	300	570	1150	1900	2850
K	405	675	1400	2650	3980

Important notice

The max. allowable torque of the individual shaft must not be exceeded.

For 2-pump combinations, there is no problem because PV series offers 100%thru torque.

For 3-pump combinations (or more), the limit torque will be reached or exceeded.

Therefore, it is necessary to calculate the torque factor and compare with the allowed torque limit factor in the table.

Requirement: calculated torque factor
< torque factor

To make the necessary calculations easier and more user friendly it is not required to calculate actual torque requirements in Nm and compare them with the shaft limitations. The table on the right shows limit factors that include material specification, safety factors and conversion factors.

The total torque factor is represented by the sum of the individual torque factors of all pumps in the complete pump combination.

The torque factor of each individual pump is calculated by multiplying the max. operating pressure p of the pump(in bar) with the max.displacement V_g of the pump(in cm^3/rev).

pump	shaft	torque limit factor
PV016-PV023 PV028	N	17700
	D	17700
	M	17700
	K	20130

PV Axial piston pump

A. Fluid recommendations

Premium quality hydraulic mineral oil fluids are recommended, like H-LP oils to DIN 51524, part2. The viscosity range should be 25 to 50 mm²/s (cSt) at 50° C. Operating temperatures –10 to +70°C. For other fluids such as phosphoric acid esters or for other operating conditions, please consult with YEOSHE for assistance.

B. Seals

NBR (Nitrile) seals are used for operation with hydraulic fluids based on mineral oil. For synthetic fluid, as perhaps phosphoric acid esters, Fluorocarbon seals are required. Please consult with YEOSHE for assistance.

C. Filtration

For maximum pump and system component functionality and life, the system should be protected from contamination by effective filtration.

Fluid cleanliness should be in accordance with ISO classification ISO 4406.

The quality of filter elements should be in accordance with ISO standards.

(1) Minimum requirement for filtration rate $\times$ (mm):

General hydraulic systems for satisfactory operation:

Class 19/15, to ISO 4406 $X=25\mu\text{m}$ ($\beta_{25} \geq 75$) to ISO 4572

(2) Hydraulic systems with maximum component life and functionality:

Class 16/13, to ISO 4406 $X=10\mu\text{m}$ ($\beta_{10} \geq 75$) to ISO 4572

It is recommended to use return line or pressure filters.

YEOSHE Filter Division offers a wide range of these filters for all common applications and mounting styles.

The use of suction filters should be avoided, especially with fast response pumps.

Bypass filtration is a good choice for best filter efficiency.

D. Installation and mounting

Horizontal mounting:

Outlet port-side or top. Inlet port-side or bottom, drain port always uppermost.

Vertical mounting: Shaft pointing upwards.

Install pump and suction line in such way that the maximum inlet vacuum never exceeds 0.8 bar absolute.

The inlet line should be as short and as straight as possible.

A short suction line cut to 45° is recommended when the pump is mounted inside the reservoir, to improve the inlet conditions. All connections should be leak-free, otherwise the air in the suction line will cause cavitations, noise, and damage to the pump.

E. Shaft rotation and alignment

Pump and motor shafts must be aligned within 0.25mm T.I.R. maximum. A floating coupling must be used.

Bellhousings and couplings can be ordered at manufacturers listed in this catalog.

Please follow the coupling manufacturer's installation instructions.

Please consult with YEOSHE for assistance on radial load type drives.

F. Start up

Prior to start up, the pump case must be filled with hydraulic fluid (use case drain port).

Initial start up should be at zero pressure with an open circuit to enable the pump to prime.

Pressure should only be increased once the pump has been fully primed.

Attention: Check motor rotation direction.

G. Operating noise of pumps

The normal operating noise of a pump and constantly-operation noise of the entire hydraulic system is largely determined by where and how the pump is mounted and how it is connected to the down stream hydraulic system. Besides, size, style, and installation of hydraulic tube are the major influence on the overall noise emitted by a hydraulic system.

General installation information

H. Noise reduction measures

Flexible elements help to prevent pump body vibration from being transmitted to other construction elements, where amplification may occur. Such elements can be:

Bell housing with elastic dampening flange with vulcanized labyrinth

- (1) Floating and flexible coupling
- (2) Damping rails
- (3) Or silent blocks for mounting the electric motor or the foot mounting flange
- (4) Flexible tube connections (compensators) or hoses on inlet, outlet, and drain port of the pump.
- (5) Exclusive use of gas tight tube fittings for inlet connections to avoid ingress of air causing cavitations and excessive noise.

I. Drain line

The drain line must lead directly to the reservoir without restriction. The drain line must not be connected to any other return line.

The end of the drain line must be below the lowest fluid level in the reservoir and as far away as possible from the pump inlet line. This ensures that the pump is not empty itself when it's not in operation and the hot aireated oil will not be recirculated.

For the same reason, when the pump is mounted inside the reservoir, the drain line should be arranged in such a way that a siphon is created. This ensures that the pump is always filled with fluid.

The drain pressure must not exceed 1 bar.

Drain line length should not exceed 2 meters.

Minimum diameter should be selected according to the port size and a straight low pressure fitting with maximized bore should be used.

	PV016/PV020/PV023 PV028	PV032/PV040/PV046 PV056/PV065	PV063~092 PV110/PV125	PV140~180 PV210	PV270
Size of pipe joints	3/8"	1/2"	3/4"	1"	1-1/4"
I.D. of pipes	Ø12 more	Ø15 more	Ø19 more	Ø25 more	Ø32 more
Length of drain	Under 1m	Under 1m	Under 1m	Under 1m	Under 1m
